

ABSTRACT OF THE DISCLOSURE

A hanging device for a suitcase includes a main body, a clamping plate pivotally mounted on the main body, a receiving chamber formed between the main body and the clamping plate, and a press plate pivotally
5 mounted on the main body and locked on the clamping plate to fix the clamping plate on the main body. Thus, the hanging device is mounted on the retractable handle of the suitcase to hang a bag (briefcase or portfolio) that is placed on the top of the suitcase and is supported by the protruding flange of the main body, thereby facilitating a user carrying the bag and the suitcase
10 simultaneously.
